The Platinum Standard of the Quantum Age

1. Executive Summary

This attachment reflects the current Ato codebase in this repository. The active implementation uses a 100-second target block time, 12 decimal places, 1 ATHO = 1,000,000,000,000 atoms, an initial 5 ATHO subsidy, 1,260,000-block halvings, a 0.625 ATHO perpetual tail reward, 6 standard confirmations, a 100-block coinbase maturity rule, and no finite maximum supply cap in consensus.

2. Network Monetary Parameters

Parameter	Current Code Value
Target block time	100 seconds
Blocks per hour	36
Blocks per day	864
Blocks per year	315,360
Decimals	12
Atoms per ATHO	1,000,000,000,000
Initial block reward	5 ATHO
Halving interval	1,260,000 blocks
Tail reward	0.625 ATHO
Tail emission start	Block 3,780,000
Coinbase maturity	100 blocks
Standard confirmations	6 across all networks
Proof-of-Work hash	SHA3-384
Signature scheme	Falcon-512
Emission type	Halving schedule with perpetual tail emission
Supply enforcement rule	Per-block subsidy validation by full nodes
Fixed max supply cap	None in the current code

3. Emission Formula

$\text{reward}(\text{height}) = \max(5 / 2^{\text{floor}(\text{height} / 1,260,000)}, 0.625) \text{ ATHO}$

4. 150-Year Supply Schedule

Table 1

Ato 150-Year Monetary Supply Projection Under the Current Emission Policy

Year	Estimated Block Height	Block Reward (ATHO)	Annual Emission (ATHO)	Cumulative Supply (ATHO)	Enforced Max Supply	Supply to Enforced Max Supply
1	315,360	5	1,576,800	1,576,800	N/A	N/A
2	630,720	5	1,576,800	3,153,600	N/A	N/A
3	946,080	5	1,576,800	4,730,400	N/A	N/A
4	1,261,440	2.5	1,573,200	6,303,600	N/A	N/A
5	1,576,800	2.5	788,400	7,092,000	N/A	N/A
10	3,153,600	1.25	394,200	10,242,000	N/A	N/A
15	4,730,400	0.625	197,100	11,619,000	N/A	N/A
20	6,307,200	0.625	197,100	12,604,500	N/A	N/A

Year	Estimated Block Height	Block Reward (ATHO)	Annual Emission (ATHO)	Cumulative Supply (ATHO)	Enforced Maximum Supply	Supply to Enforced Maximum
25	7,884,000	0.625	197,100	13,590,000	N/A	N/A
30	9,460,800	0.625	197,100	14,575,500	N/A	N/A
40	12,614,400	0.625	197,100	16,546,500	N/A	N/A
50	15,768,000	0.625	197,100	18,517,500	N/A	N/A
75	23,652,000	0.625	197,100	23,445,000	N/A	N/A
100	31,536,000	0.625	197,100	28,372,500	N/A	N/A
125	39,420,000	0.625	197,100	33,300,000	N/A	N/A
150	47,304,000	0.625	197,100	38,227,500	N/A	N/A

Note. The projection uses the current code constants: 100-second blocks, 315,360 blocks per year, a 5 ATHO initial subsidy, 1,260,000-block halvings, and a perpetual 0.625 ATHO tail reward. Because the current code does not enforce a finite maximum ATHO supply, cap-based percentage and remaining-supply fields are not applicable.

5. Notes and Assumptions

- The schedule is based on the current repository code rather than older planning language.
- Yearly checkpoints represent end-of-year heights under the target cadence.
- Subsidy figures exclude transaction fees because fees do not mint new ATHO.
- Tail emission begins at block 3,780,000, or roughly year 11.99 under current constants.
- The current repository does not enforce a 78,000,000 ATHO maximum supply.

6. Final Policy Statement

Atho's monetary policy is designed to be deterministic, auditable, and enforceable by every full node. Under the current code, no block may create ATHO beyond the consensus-defined subsidy schedule for its height, but the present implementation does not yet enforce a finite maximum ATHO supply cap.
